INTERMITTENT SPRING

3D GEYSER LAB

Pressure accumulation · flash boiling · eruption dynamics · steam & mist · periodic timing

Parameters | Telemetry

drag orbit · scroll zoom
space pause · E erupt · B bleed · C cutaway

GEOLOGICAL WONDER

5 fields

Old Faithful | Strokkur | Steamboat | Pōhutu | El Tatio Field

Yellowstone, Wyoming

The metronome of the Upper Geyser Basin — predictable within ±10 minutes.

- Interval 60–110 min; longer eruptions predict longer waits.
- Column reaches 32–56 m and expels 14–32 m³ of water.
- Water at the vent is ~95 °C; steam exits near 175 °C.

Cycle | Fluid | World | Debug

TRIGGER MODE

AUTOMATIC | MANUAL

The spring erupts on its own whenever reservoir pressure crosses the trigger threshold.

PLUMBING & PRESSURE

Recharge rate 5.5 %/s

How fast heat + inflow rebuild chamber pressure

Trigger pressure 0.82 bar*

Flash-boiling threshold at the constriction

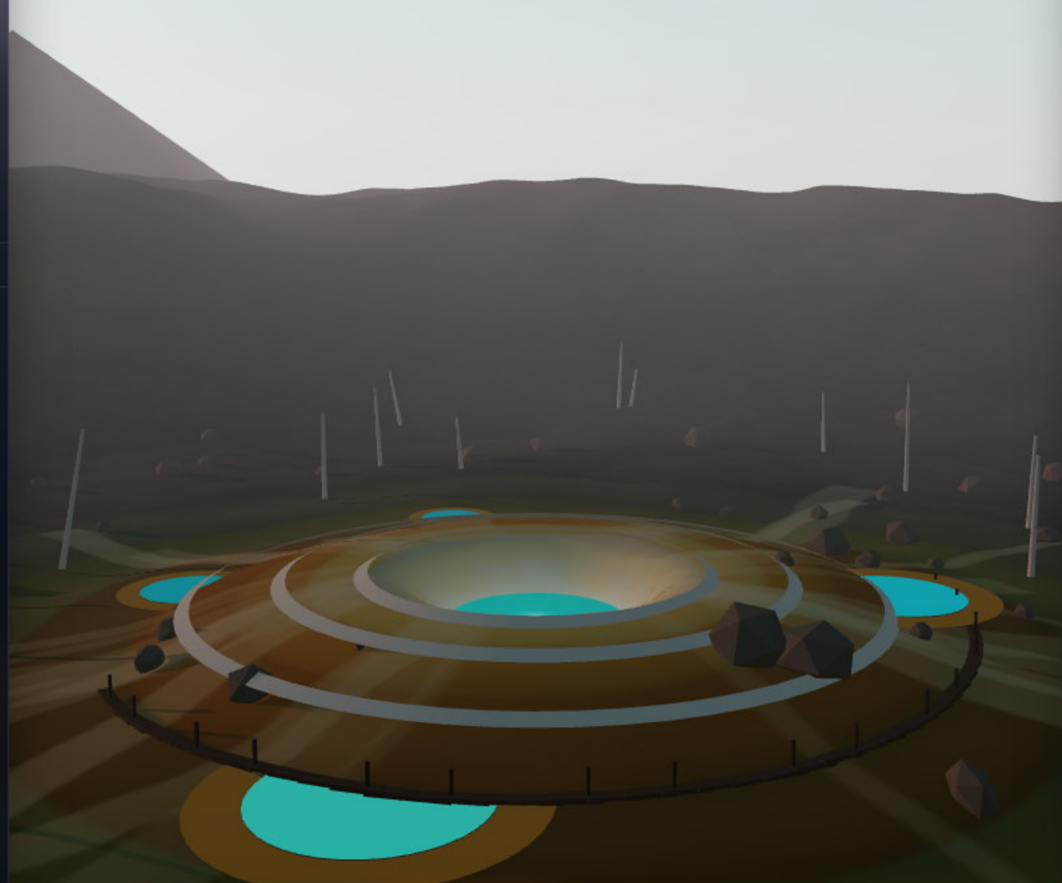
Chamber volume 26.0 m³

Eruptible water — sets how long the play lasts

Conduit radius 0.90 m

Throat width: wider = fatter, shorter burst

Exit velocity 34.0 m/s



0.44
BAR*
128°C

RECHARGE

0:06

UNTIL NEXT ERUPTION

Groundwater refills the chamber, heat from the magma body builds pressure.

RECHARGE | PRECURSOR | ERUPTION | STEAM

RESERVOIR PRESSURE	0.44 bar*
CHAMBER FILL	91 %
COLUMN HEIGHT	0.0 m
